

A new dimension for Citrix®.

A new opportunity for Citrix partners.

enteo's® NetInstall® Optimal Server and Profile Configuration Management for Citrix

enteo's NetInstall introduces a new dimension to Citrix with a complete management solution for MetaFrame Presentation Server farms. enteo's NetInstall offers automated deployment of individual servers and complete server farms as well as automated publishing of applications based on a structured application installation process.

enteo's NetInstall has been specifically engineered to streamline the initial installation and configuration of Citrix MetaFrame Presentation Servers as well as the ongoing life cycle management of Citrix environments. It was written from the ground up by administrators for administrators.

enteo's NetInstall's integrated support of Citrix MetaFrame Presentation Server reduces the complexity of Citrix environments, helps keep server configurations synchronized and supports the growth of any customer's access strategy.

A "win-win" for Citrix Channel Partners

By adding enteo's NetInstall to your existing arsenal of Citrix-related products, you not only benefit from an additional and complimentary offering that can be easily sold into the existing customer base, you can now also ease the implementation of Citrix for new customers. The end result is increased revenues, additional market opportunities and greater customer satisfaction.

enteo is a Premier member of the Citrix Alliance Partners program. enteo account representatives are located throughout America and Europe and are available to support Citrix field personnel.

the enteo promise

enteo's NetInstall can be implemented to production within weeks, instead of months, and does not require specific programmer knowledge or scripting experience. The result is a tremendous reduction in total-cost-of-ownership which is what makes NetInstall stand apart from the competition. We don't just make this claim, we back it up with proof through live demonstration.

enteo's NetInstall Benefits

Flexible OS installation and maintenance

Where manual installation and maintenance of operating systems, drivers, patches, hot fixes, security settings, MetaFrame installation, etc. can take several days, enteo's NetInstall® offers a much more efficient alternative. With enteo's NetInstall, Citrix administrators can simply create a configuration file or database containing the specific properties of the server and specify the server's specific role. enteo's NetInstall initiates automatic installation without any manual intervention.

Automated server build and disaster recovery

As a primary element of disaster recovery, enteo's NetInstall enables the automation of required configuration changes, software installations and patch deployments. This policy-based deployment approach keeps servers synchronized within the farm and allows for adding new servers by simply plugging them in. enteo's NetInstall builds the system image from a bare-metal level and executes all tasks required to get the new machine synchronized with the other servers.

Once enteo's NetInstall's management approach has been deployed, customers can expand their Citrix farm without expanding their staff, therefore saving time and money.

Streamlined security management

Maintaining security has become vital to Citrix customers throughout the world. Software vendors like Microsoft, SAP, Oracle and others constantly release new patches, hotfixes and service packs to cover newly discovered security vulnerabilities. Smaller server farms will benefit from enteo's NetInstall's ability to fully automate the entire update process and minimize downtime. Larger server farms with load balancing resources will additionally benefit by eliminating the need to manually reinitiate patch delivery.

enteo's NetInstall's automated Security Patch Deployment helps Citrix customers meet deadlines and security standards and live up to service level agreements. NetInstall also comes with built-in tools to change security settings such as local administration passwords, file system, service and registry permissions.

Simplified profile configuration management

NetInstall's unique user profile management capabilities can reduce software compatibility problems and ease the customization of user specific configuration settings such as mail profiles. The ability to customize user environments and desktops within the Citrix Access Infrastructure, and offer user-specific application sets, provides more flexibility and greater user satisfaction.

More efficient change management

One of enteo's NetInstall's key benefits is that administrators can simulate and test all changes before deploying them to other servers. This flexibility provides a vast array of management and versioning benefits and also guarantees that the latest changes are available simultaneously on all servers. Maintenance timeframes can be defined to ensure 24/7 farm availability and an elaborate user notification and logoff process ensures customer satisfaction. For remote branches with their own distribution and MetaFrame Presentation Servers, a package only needs to be transmitted once. This saves time, money and personnel resources.

About enteo Software

enteo is a world leading software company, providing solutions for software and application management, covering software packaging and deployment, automated server build, patch management, security management, hardware and software inventory, remote control and user profile management for Citrix® MetaFrame® Presentation Servers. enteo's software currently serves more than 2,400 satisfied customers and 2.5 million managed devices around the world.
