

GoldSync® helps your team work together.

A well-informed team is a successful team. Give everyone—from field salespeople to staff at branch locations—the advantage of up-to-the-minute information with the automated synchronization capabilities of GoldSync 6.5.

GoldSync keeps you connected.

Don't make your team wait for the latest details; deliver current information faster and easier. Instant Sync in GoldSync automatically prompts users to initiate their synchronization session and instantly synchronizes the most recent changes and additions—including leads, account updates, and sales and marketing materials—every time a user logs on to your GoldMine® network.

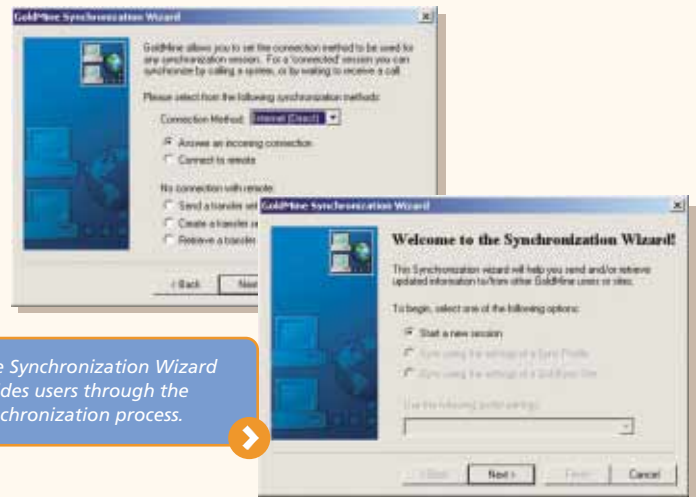

GoldSync handles the entire synchronization process, even for multiple remote users and sites. With automated and unattended "agent" functions that administer when, what and how information is synchronized, GoldSync gives you total control of information access and distribution.

Be prepared to create opportunities.

Keep your team ready for every opportunity. GoldSync tracks critical, just-in-time customer information on your GoldMine network to enable real-time collaboration across your entire organization.

Immediate access to important information

Keep moving while you keep in touch with prospects, customers and team members. GoldSync easily extends information to your entire organization, regardless of where individuals are located or when they connect. GoldSync 6.5 can be configured to run as a Microsoft® Windows® Service to reduce administration time and increase security.

The Synchronization Wizard guides users through the synchronization process.

The GoldSync Administration Center allows you to assign properties to individuals and users, so you control who gets what information.

Tools to keep you on top of your information

Your team members are only as effective as the information you provide them. GoldSync® 6.5 is designed to manage the distribution of business and customer information across your entire company.

- Up-to-the-Minute Details**
 GoldSync easily keeps your entire team current with business and customer contact information—including special notes and “linked” documents like quotes and proposals, sales figures, territory realignments, marketing materials and scheduled activities.
- Connect from Anywhere, Anytime**
 Choose the connection method that works best for your business, including IP-to-IP options, shared network folders and Internet e-mail.
- Automatic Synchronization**
 The administrator can establish a profile in the GoldSync Administration Center that allows an undocked user to automatically and transparently update information whenever necessary from wherever he or she is.
- GoldSync System Services**
 Now administrators and remote users can easily stay up to date with GoldMine® 6.5 by setting up Microsoft® Windows® Services.
- Complete Control**
 Distribute information to GoldMine 6.5 users and sites (licenses) using filters to control the specific content sent to each location or representative, thereby eliminating possible territory conflicts.

- Up and Running in Minutes**
 The GoldSync “undocked” installer makes deploying GoldMine for a large number of remote users a breeze. Administrators can distribute a single executable to remote, undocked staff that installs a fully configured and completely populated GoldMine system.
- Protect Your Information Assets**
 The three levels of synchronization security include serial number, site ID and optional user password validation. In addition, GoldSync automatically encrypts all of the information included in each data packet (transfer set) that it sends/receives to ensure the integrity of your company’s information.
- Pain-Free Licensing**
 GoldSync offers an “undocking” capability for added licensing flexibility. From the main system, administrators can create undocked licenses for any salespeople that work both in and out of the office as well as sublicenses for branch locations and sites.
- A Comfortable, Cost-Effective Environment**
 The GoldSync Administration Center offers a familiar Microsoft Windows / Internet Explorer–style interface for standardized setup and management of remote GoldMine users and sites. Step-by-step wizards guide you through the establishment of sites, processes and servers.

GoldSync 6.5 synchronization also includes a detailed log of transferred information, so you only send what’s new or updated—keeping your connection times to a minimum.

GoldSync gives you complete control over the information you send.

SYSTEM REQUIREMENTS

- Microsoft Internet Explorer 6.0
- 266-MHz Pentium® II or higher IBM-compatible PC
- 128 MB RAM
- 500 MB free hard drive space
- Microsoft Windows 2000 (Server/Advanced Server), Windows 2003
- MS-DOS® 3.1 File- and Record-Locking-Compatible Network
